### **Strategy Definitions :**

"Arbitrage" the practice of simultaneously buying some securities and selling others that are close substitutes when their relative value price have diverged, in the hope of profiting when their prices revert to their normal relationships.

"Event Driven" aims to benefit from mis-pricing arising in events such as merger arbitrage, restructuring, etc. The manager takes a position in an undervalued security that is anticipated to rise in value because of events such as mergers, reorganisation or take overs. The main risk in such strategies is non-realisation of the event.

"Fixed income Arbitrage" are strategies designed to eliminate or reduce exposure to direction of interest rates, while profiting from anomalies in yield curve shape, mis-pricing of government and non-government securities and other sector mis-pricing. The risk of these strategies varies depending on duration, credit exposure and the degree of leverage employed.

"Hedge Fund" are actively traded strategies where the managers buy and sell stocks, bonds, futures, options and other derivatives.

Hedge fund managers have the ability to hedge out unwanted systematic market risk and may also employ leverage.

Because of these factors, hedge funds are subject to unique risks compared to traditional investments.

"Leverage" arises where the investor's financial exposure to moves in the price of the underlying asset exceeds that implied by the capital invested by the investor. Leverage can be achieved by borrowing to invest, by purchasing securities or instruments (eg. Futures) on margin, or by purchasing certain types of derivatives (such as options).

"Long" the state of buying and actually owning a security, contract, or commodity.

"Long short Equity" involves investing in equity or equity like instruments where the net exposure is generally either significantly net long, or net short. The primary risk relates to the individual long short position.

"Market Neutral" A strategy featuring offsetting long and short positions in different securities. The managers aims to profit for both falls and rises in share values while remaining insulated from systematic equity market movements.

"Maximum Draw Down" the largest cumulative negative return. This period may extend beyond the one year quantitative analysis period.

"Short" An allocation to a security that is less than that implied in the benchmark. Where no benchmark is used, this is achieved by borrowing the security for a period and selling it with the hope of buying it back later at a lower price.

"Standard Deviation" Standard Deviation measures the dispersal or uncertainty in a random variable (in this case investment returns). It measures the degree of variation of returns around the mean (average). The higher the volatility of the investment returns, the higher the standard deviation will be. for this reason, std dev is often used as a measure of investment risk.

"Sharpe Ratio" A return/risk measure developed by William Sharpe that aims to determine whether the returns of the portfolio were because of small investment decisions or
